Cellular Solids: Structure and Properties - Lorna J ...

Generally speaking, cellular solids have relative densities which are less than about 0.3; most are much less – as low as 0.003. At first sight one might suppose that the cell size, too, should be an important parameter, and sometimes it is; but (as later chapters show) most mechanical and thermal properties depend only weakly on cell size.

Cellular Solids: Many materials have a cellular structure, with either a two-dimensional array of prismatic cells, as in a honeycomb, or a three-dimensional array of polyhedral cells, as in a foam. Engineering honeycombs and foams can now be made from nearly any material: polymers, metals, ceramics, glasses and composites, with pore sizes ranging from nanometers to millimeters.
