Chapter menu Resources Chapter 21 Quantum Energy • Einstein later applied the concept of quantized energy to light. The units of light energy called quanta (now called photons) are absorbed or given off as a result of electrons “jumping” from one quantum state to another. $E = hf$ energy of a quantum = Planck's constant \times frequency

Quantization of Energy | Physics

Oct 19, 2014 The quantization of energy refers to the fact that at subatomic levels, energy is best thought of as occurring in discreet "packets" called photons. Like paper money, photons come in different denominations. You can, for example, purchase items with a one dollar bill or a five dollar bill, but there are no three dollar bills.

Energy is quantized in some systems, meaning that the system can have only certain energies and not a continuum of energies, unlike the classical case. This would be like having only certain speeds at which a car can travel because its kinetic energy can have only certain values. We also find that some forms of energy transfer take place with discrete lumps of energy.
