Endocrine System

The nervous system connects directly to target cells and organs, while the endocrine system uses hormones and chemical signals to send messages to target cells and organs. c. The nervous system controls muscle contraction, automatic responses, and voluntary actions, while the endocrine system uses hormones that can change permeability of cell membranes, activate or deactivate enzymes, or stimulate mitosis.

specific receptor protein. 4. Hormone-receptor complex binds to DNA. 5. Activates transcription &

The Endocrine System

Chapter 9 The Endocrine System When insulin molecules, carried passively along in the blood, leave the blood and bind tightly to protein receptors of nearby cells, the response is dramatic: Bloodborne glucose molecules begin to disappear into the cells, and cellular activity accelerates. Such is the power of the second great controlling system of the body, the endocrine system.

Endocrine ...

In the pituitary, then, cells of the central nervous system and the endocrine system meet and live as near neighbors. The endocrine system is highly complex, and its organs are many and varied. Some endocrine organs, such as the Ovary and Testis, have already been discussed. In this chapter, several of the major endocrine organs are illustrated by light and electron microscopy - the thyroid gland, the adrenal gland, and the pituitary gland.
