Genetic Variation In Solanum

The evolutionary history of Solanum genomes has also been investigated from the perspective of chromosome organization. The study by Szinay et al. involving cross-species BAC FISH painting of Solanum species revealed few large rearrangements in the short arm euchromatin of chromosomes 6, 7 and 12, whereas Anderson et al.

Tomato (*Solanum lycopersicum* L.) is an economically important vegetable crop worldwide and a pre-eminent plant genetic analysis system. Genetic marker development for tomato has been conducted over 30 years through various approaches, including restriction fragment length polymorphism (RFLP), random amplified polymorphic DNA (RAPD), amplified fragment length polymorphisms (AFLPs), simple

Genebanks seek to understand the partitioning of genetic diversity among species, populations, and individuals in their collections since this informs decisions for adopting the most effective sampling strategy.
