The main Hibernate ORM artifact is named hibernate-core. There are also a number of optional artifacts based on what specific features you wish to use. These are discussed in the Getting Started Guide. To use Hibernate ORM in your own project you just need to name a dependency on it in your project. From Maven.

~~Getting started with Hibernate ORM — Hibernate ORM~~

Hibernate is an Object/Relational Mapping (ORM) solution for Java environments. The term Object/Relational Mapping refers to the technique of mapping data between an object model representation to a relational data model representation. See http://en.wikipedia.org/wiki/Object-relational_mapping for a good high-level discussion.

If you just need to get an entity by its primary key, you can use the find method of your EntityManager. Author a = em.find(Author.class, 1L); As you can see in the code snippet, you just need to provide the class of your entity and its primary key. Hibernate then uses the mapping information of the entity to generate an SQL SELECT statement.

First you have to tell Hibernate Search which DirectoryProvider to use. This can be achieved by setting the hibernate.search.default.directory_provider property. Apache Lucene has the notion of a Directory to store the index files. Hibernate Search handles the initialization and configuration of a Lucene Directory instance via a DirectoryProvider.
