Seismic isolation is a viable design strategy that has been used for seismic rehabilitation of existing buildings and in the design of a number of new buildings. In general, this system will be applicable to the rehabilitation and design of buildings whose owners desire superior earthquake performance and can afford the special costs associated with the design, fabrication, and installation of seismic isolators.

Fig. 14 depicts an unidirectional seismic isolation device suitably designed and patented, which provides seismic isolation to the rack in the cross-aisle direction only, similarly to the system described above in Section 3.3. As already discussed, the fundamental period of the rack in the cross-aisle direction is usually much lower than in the down-aisle direction, and thus this direction is the most affected by earthquake-induced effects.

A K_s by (2.16) That is, the weaker the stiffness is chosen, the smaller value of A_s can be achieved, which is the basis for current design practice of seismic isolation. From the above discussion, it seems that, as long as K_b is smaller than a certain level, the base isolation would be successful.

Design Principles of Seismic Isolation

Isolation devices are installed under the building, and decouple the structure from the earthquake motions. Seismic isolation can reduce the shaking of the building dramatically. The seismic isolation method has become possible through the development of laminated rubber bearings. Figure 5 shows a cross-sectional view of a laminated rubber bearing. The rubber bearing consists of multiple layers of thin rubber sheets and reinforcing steel plates, and has very low horizontal stiffness.

Review on seismic isolation and response control methods ...

It is meant to enable a building or non-building structure to survive a potentially devastating seismic impact through a proper initial design or subsequent modifications. In some cases, application of base isolation can raise both a structure's seismic performance and its seismic sustainability considerably.
