IPC Users Guide. Inter-Processor

Communication (IPC)

provides a processor-agnostic API which

can be used for communication

between processors

in a multi-processor

environment (inter-

core), communication

to other threads on

same processor (inter-

process), and communication to peripherals (inter-device). The API supports message passing, streams, and linked lists.

IPC is a component containing packages that are designed to

allow communication between processors in a multi-processor environment and communication to peripherals. This communication includes message passing, streams, and linked lists. These work transparently in both uni-processor and multi-processor configurations.

The ti.sdo.ipc.Notify module manages the multiplexing/demultiplexing of software interrupts over hardware interrupts. In order to use any Notify APIs, you must first call `Ipc_start()`.

This sets up all the necessary Notify drivers, shared memory, and interprocessor interrupts.

IPC provides an implementation of the IMessageQTransport

interface called `ti.sdo.ipc.transports.TransportShm` (shared memory). You can write other implementations to meet your needs. When a transport is created via a transport-specific `create()` call, a remote processor ID (defined via the `MultiProc` module) is specified.
